

Breakthrough Technology for Window Manufacturers

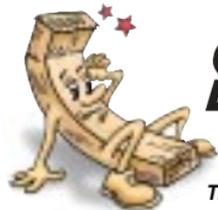

SAFE-GARD® THIN COMPOSITES

SAFE-GARD® dry-laminated composite film has passed the stringent test standards of the Dade County 2 by 4 missile impact and cycling requirements of the Southern Florida Building Code. This breakthrough brings about a cost-effective way for window manufacturers to offer windows and doors that are less costly and lighter than products employing PVB laminated glass.

SAFE-GARD® can be incorporated into most window applications and IG units without affecting the integrity or durability of the seal and without adding extra weight to window sashes.

SAFE-GARD® meets ANSI Z97.1 (Unlimited) and CPSC 1201, Category II safety glazing standards and has received an NES certificate of compliance (www.nateval.org) with the provisions of the 2000 International Code Council, BOCA National, SBCCI, and ICBO Uniform Standards.

The Original Impact Resistant Composite
